The key cellular process identified with energy production is **photosynthesis**.

Photosynthesis is the process in which green plants use the energy of sunlight to convert water and carbon dioxide into high-energy carbohydrates and oxygen.

Van Helmont's Experiment

In the 1600s, Jan van Helmont wanted to find out if plants grew by taking material out of the soil.

He determined the mass of a pot of dry soil and a small seedling, planted the seedling in the pot, and watered it regularly.

After five years, the seedling was a small tree and had gained 75 kg, but the soil's mass was almost unchanged.

Photosynthesis

Slide 4 of 28

Van Helmont concluded that the gain in mass came from water because water was the only thing he had added.

His experiment accounts for the "hydrate," or water, portion of the carbohydrate produced by photosynthesis.

But where does the carbon of the "carbo-" portion come from?

8-2 Photosynthesis: An Overview 📥 Investigating

Photosynthesis

Slide 5 of 28

Although van Helmont did not realize it, carbon dioxide in the air made a major contribution to the mass of his tree.

In photosynthesis, the carbon in carbon dioxide is used to make sugars and other carbohydrates.

Van Helmont had only part of the story, but he had made a major contribution to science.

Priestley's Experiment

More than 100 years after van Helmont's experiment, Joseph Priestley provided another insight into the process of photosynthesis.

Priestley took a candle, placed a glass jar over it, and watched as the flame gradually died out.

He reasoned that the flame needed something in the air to keep burning and when it was used up, the flame went out. That substance was oxygen.

8-2 Photosynthesis: An Overview 🛸 Investigating

Photosynthesis

Slide 7 of 28

Priestley then placed a live sprig of mint under the jar and allowed a few days to pass.

He found that the candle could be relighted and would remain lighted for a while.

The mint plant had produced the substance required for burning. In other words, it had released oxygen.

Investigating Photosynthesis

> Slide 8 of 28

Jan Ingenhousz

Later, Jan Ingenhousz showed that the effect observed by Priestley occurred only when the plant was exposed to light.

The results of both Priestley's and Ingenhousz's experiments showed that light is necessary for plants to produce oxygen.

8-2 Photosynthesis: An Overview 🛋 Investigating

Investigating Photosynthesis

> Slide 9 of 28

The experiments performed by van Helmont, Priestley, and Ingenhousz led to work by other scientists who finally discovered that, in the presence of light, plants transform carbon dioxide and water into carbohydrates, and they also release oxygen.

8-2 Photosynthesis: An Overview **w** The Photosynthesis

The Photosynthesis Equation

> Slide 10 of 28

What is the overall equation for photosynthesis?

The Photosynthesis Equation

The equation for photosynthesis is:

$$6CO_2 + 6H_2O \xrightarrow{\text{Light}} C_6H_{12}O_6 + 6O_2$$

carbon dioxide + water $\xrightarrow{\text{Light}}$ sugars + oxygen

What is the role of light and chlorophyll in photosynthesis?

Light and Pigments How do plants capture the energy of sunlight? In addition to water and carbon dioxide, photosynthesis requires light and chlorophyll.

Copyright Pearson Prentice Hall

Slide 13 of 28 Plants gather the sun's energy with light-absorbing molecules called **pigments**.

The main pigment in plants is chlorophyll.

There are two main types of chlorophyll:

- chlorophyll a
- chlorophyll b

Slide 14 of 28 Chlorophyll absorbs light well in the blue-violet and regions of the visible spectrum.

Slide 15 of 28

Chlorophyll does not absorb light well in the green region of the spectrum. Green light is reflected by leaves, which is why plants look green.

PEARSON

Slide 16 of 28 8-2 Photosynthesis: An Overview 🛋

Absorption Spectra of different pigments

PEARSON Prentice Hall Slide 17 of 28 Light is a form of energy, so any compound that absorbs light also absorbs energy from that light.

When chlorophyll absorbs light, much of the energy is transferred directly to electrons in the chlorophyll molecule, raising the energy levels of these electrons.

These high-energy electrons are what make photosynthesis work.

8-2 Section QUIZ

Copyright Pearson Prentice Hall

Slide 19 of 28

- In van Helmont's experiment, most of the added mass of the tree came from
 - a. soil and carbon dioxide.

b. water and carbon dioxide.

- c. oxygen and carbon dioxide.
- d. soil and oxygen.

Slide 20 of 28

- 2
- Plants use the sugars produced in photosynthesis to make
 - a. oxygen.
 - b. starches.
 - c. carbon dioxide.
 - d. protein.

Slide 21 of 28 3

The raw materials required for plants to carry out photosynthesis are

- a. carbon dioxide and oxygen.
- b. oxygen and sugars.
- c. carbon dioxide and water.
- d. oxygen and water.

Slide 22 of 28 4

The principal pigment in plants is

a. chloroplast.

b. chlorophyll.

- c. carotene.
- d. carbohydrate.

Slide 23 of <u>28</u>

- 5 The colors of light that are absorbed by chlorophylls are
 - a. green and yellow.
 - b. green, blue, and violet.
 - c. blue, violet, and red.
 - d. red and yellow.
