

# Still more gas laws...

Avagadro's principle tells us that even though gas molecule sizes may differ, under the same temp. conditions they occupy the same volume.

\* remember under STP (standard temp. & pressure -  $0.0^{\circ}\text{C}$  &  $1\text{atm}$ )  
1 mole of gas =  $6.02 \times 10^{23}$  particles =  $22.4\text{L}$

Using all of the gas laws learned we can draw a new all-encompassing equation called the ideal gas law, which states

$$PV = nRT$$

$P =$  pressure (atm)      $V =$  volume (Liters)  
 $n =$  number of moles  
 $R =$  gas constant ( $0.0821\text{ L}\cdot\text{atm}/\text{mol}\cdot\text{K}$ )  
 $T =$  Temp. (kelvin)

\* This tells us that the product of  $P \times V$  is constant under controlled/constant Temp.

(We can solve for any variable if we know the other 4)

ex)  $P = 2\text{atm}$       $R = 0.0821\text{ L}\cdot\text{atm}/\text{mol}\cdot\text{K}$   
 $V = 5.0\text{L}$       $T = 300\text{K}$   
 $n = X$

$$PV = nRT$$
$$\frac{(2)(5.0)}{(0.0821 \times 300)} = \frac{n(0.0821)(300)}{(0.0821)(300)} \quad n = 0.41\text{ mol}$$

2

\* when using kPa,  $R = 8.3145 \text{ L} \cdot \text{kPa} / \text{mol} \cdot \text{K}$

ex)  $P = \overset{25 \text{ kPa}}{\text{1 atm}}$        $R = 8.3145 \text{ L} \cdot \text{kPa} / \text{mol} \cdot \text{K}$   
 $V = 1.5 \text{ L}$        $T = X$   
 $n = 0.3 \text{ mol}$

$$PV = nRT$$
$$\frac{(25)(1.5)}{(0.3)(8.3145)} = \frac{(0.3)(8.3145)X}{(0.3)(8.3145)} = \boxed{15.03 \text{ K}}$$

\* on homework -  $760 \text{ torr} = 1 \text{ atm}$

so,  $720 \text{ torr} \rightarrow \text{atm} = \frac{720}{760} = \underline{0.95 \text{ atm}}$
